## About this book

## Introduction

This book focuses on the development and implementation of cloud-based, complex software that allows parallelism, fast processing, and real-time connectivity. Software engineering (SE) is the design, development, testing, and implementation of software applications, and this discipline is as well developed as the practice is well established whereas the Cloud Software Engineering (CSE) is the design, development, testing, and continuous delivery of service-oriented software systems and applications (Software as a Service Paradigm). However, with the emergence of the highly attractive cloud computing (CC) paradigm, the tools and techniques for SE are changing. CC provides the latest software development environments and the necessary platforms relatively easily and inexpensively. It also allows the provision of software applications equally easily and on a pay-as-you-go basis. Business requirements for the use of software are also changing and there is a need for applications in big data analytics, parallel computing, AI, natural language processing, and biometrics, etc. These require huge amounts of computing power and sophisticated data management mechanisms, as well as device connectivity for Internet of Things (IoT) environments. In terms of hardware, software, communication, and storage, CC is highly attractive for developing complex software that is rapidly becoming essential for all sectors of life, including commerce, health, education, and transportation.

The book fills a gap in the SE literature by providing scientific contributions from researchers and practitioners, focusing on frameworks, methodologies, applications, benefits and inherent challenges/barriers to engineering software using the CC paradigm.

## Journals

Taylor & Francis Group's journal program provides a home for validated, trusted research from the world's brightest and best minds. Our approach to publishing has a human-centered focus and we believe that, properly harnessed, the research that we curate has the power to transform lives for the better.

We publish research papers on a range of platforms, and along the way, we make it easy for authors to *Choose Open* from our current and growing range of open research options.

- [Taylor & Francis Online](http://www.tandfonline.com/) (<http://www.tandfonline.com/>) brings together over 2,700 journals, including the world's largest program of Social Science and Humanities journals published by Routledge; cutting-edge theoretical and applied Science, Technology and Medicine content from Taylor & Francis; and CogentOA, a suite of broad-spectrum open access journals. Journals on this platform support open access and more traditional subscription routes to publication.
- [DovePress](http://www.dovepress.com) (<http://www.dovepress.com>) are open access specialists with a focus on publishing medicine in a suite of peer-reviewed journals.
- [F1000Research](https://f1000research.com/) (<https://f1000research.com/>) is an open access platform that is challenging thinking on how research should be published. Its philosophy encourages authors to publish all findings including null results, data notes and more. The F1000 Research workflow is transparent end-to-end and allows authors to engage with reviewers openly and transparently.

The goal of all of these programs is to accelerate the impact of trusted research with a range of best-in-class journals, services and technologies.

To read articles that require a subscription through your institution's library when you're off campus, [visit the Taylor & Francis Online Help Center](https://help.tandfonline.com/s/article/How-do-I-view-content) (<https://help.tandfonline.com/s/article/How-do-I-view-content>) to get set up with remote access.

**Type:** Journal Article

**Abstract:** In summer 2018, central and northern Europe were stricken by extreme drought and heat (DH2018). The DH2018 differed from previous events in being preceded by extreme spring warming and brightening, but moderate rainfall deficits, yet registering the fastest transition between wet winter conditions and extreme summer drought. Using 11 vegetation models, we show that spring conditions promoted increased vegetation growth, which, in turn, contributed to fast soil moisture depletion, amplifying the summer drought. We find regional asymmetries in summer ecosystem carbon fluxes: increased (reduced) sink in the northern (southern) areas affected by drought. These asymmetries can be explained by distinct legacy effects of spring growth and of water-use efficiency dynamics mediated by vegetation composition, rather than by distinct ecosystem responses to summer heat/drought. The asymmetries in carbon and water exchanges during spring and summer 2018 suggest that future land-management strategies could influence patterns of summer heat waves and droughts under long-term warming.
